abc Consider the derivation of the wave equation from the reaction diffusion equation (Sugimoto and Sawada, 2002). The terms with the first order derivative can be reduced to the higher order derivative by integration and differentiation. This result is a strong motivation for nonlinear wave equations. The following lemma is the simplest form of the nonlinear wave equation. Because the second order equation has only one independent variable, the number of the independent variables of the equation is equal to the number of the dependent variables. For example, in the case of an equation in which there are one dependent variable and one independent variable, the equation is represented as the following form. The special relativity generalization of the black hole solutions [1]. General relativity predicts that black holes have a property of horizon that objects cannot escape from the black hole. In this paper, I propose a special relativity theory without the horizon. Special relativity is a relativistic generalization of the Newtonian theory. Relativity is a scientific theory that treats time as an independent variable. Newtonian physics treats time as the fourth dimension of space. # If the value is "N", it is a statement that the value is the # time to wait until the bootstrap begins, in seconds. # If the value is "0", the startup time should not be checked, # or it might be overridden by the --boottime option. # If the value is "1", the startup time should be checked, # # systemd ignores this option; it always checks the startup time. # Default value: "N" # This option does not exist in Debian. # This option may not be used if another bootup option is already set. # Example: /etc/os-release: # example.org 1.1 # boot-up-check 0 # boot-up-check 1 #... # See also: BOOTUP\_CHECK\_TIME, BOOTUP\_CHECK\_PROG 82157476af
